

# Introduction

XpoLog is a Log Analysis Platform that helps applications and operations teams to quickly search, investigate, and navigate through application problems and IT metrics. It offers a centralized perspective covering multiple logs from local and remote infrastructure, including servers, applications, machines, and data centers, all in real-time through a standard web-browser. XpoLog is a non-intrusive, agent-less solution, which does not require any changes to the IT configuration or code.

With XpoLog, operation/production support personnel can:

- Collect and analyze end-user transaction logs
- Perform advanced searches on consolidated logs
- Correlate log events by transactions
- Accelerate problem isolation and troubleshooting
- Automatically detect errors and risks without prior configuration
- Receive alerts based on risk levels and other predefined rules

With XpoLog, application teams can:

- Analyze software logs during testing
- Detect bugs before going live
- Automatically detect risks and monitor problems
- Correlate log events by transactions
