

Most Severe Problems Table

For each selected view type and time frame, Analytics presents the top 10 problems (with the highest severity) that were found in the analysis:

Folders and Logs Most Severe Problems					
Source	Problem	Type	# of Occurrences	Severity	
Windows Event Logs	Event 680 on a domain controller indicates a failed logon via NTLM with a domain account	Autodetected	6	High	
Windows Event Logs	ERROR	Autodetected	25	Medium	
Windows Event Logs	error_code	Autodetected	9	Medium	
Windows Event Logs	skypeupdate service is shutting down due to idle timeout	Autodetected	5	Medium	

For each detected problem there is an option to modify its severity or exclude it from the analysis directly in the console.

The Most Severe Problems Table includes the following columns:

Column	Description
Source	The source folder/log/application/server that contains the problem
Problem	A short description of the problem; clicking the problem has the same function as clicking the Search in XpoSearch button (see below).
Type	The problem type; can be Predefined, Autodetected, Statistical, or Metrics
# of Occurrences	The number of occurrences of this problem
Severity	The severity assigned to this problem
	Search in XpoSearch button; clicking this button enables searching for the event in the log.

Customize the Problem Severity button; clicking this button enables the user to change the problem severity, or exclude the problem from the analysis. Changes take effect only in future analyses.
